by Todd Honeycutt, <u>Issue Brief, November 2009</u>, Number 1, Mathematica Policy Research, Inc. 4 pages

Abstract: â??Social network analysis (SNA) is a methodological approach to measuring and mapping relationships. It can be used to study whole networks, all of the ties within a defined group, or connections that individuals have in their personal communities. The resulting graph-based structures illustrate the composition and effectiveness of networks on a variety of levels. Programs that can benefit from a social network perspective are common in evaluation research. This brief introduces the concepts behind SNA and illustrates how to use this method in process and outcome evaluations.â?•
